

What is SprayDays?

SprayDays is the Department of Pesticide Regulation's proposed statewide pesticide application notification system that will provide equitable and transparent public access to information prior to the application of higher risk pesticides in California.

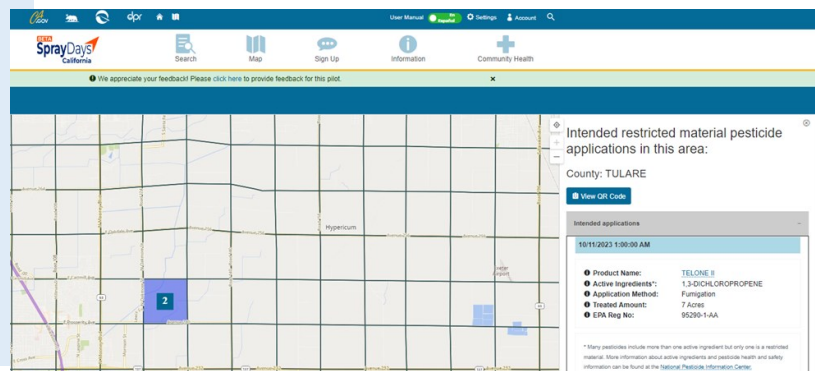

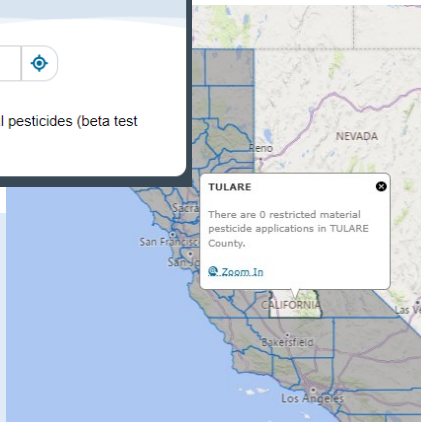

How Does SprayDays Work?

SprayDays provides a searchable online map that allows users to anonymously view information on upcoming pesticide applications. Users can also sign-up to receive information about upcoming applications sent via text message or email 24-48 hours before an application is planned.

Proposed Information Included on Pesticide Applications:

- Location of intended application within one square mile (see image to right)
- Intended date and time of the application
- Product name
- Active ingredient
- Application method

What Information will be Included on the SprayDays Website?

The **Community Health** page will provide information about what to do if exposed to a pesticide, common symptoms of exposure, and best practices for working or living near pesticide applications. The **Information Page** will describe how pesticides are evaluated for human health and environmental risks before they can be used in California and the regulatory structure to protect people and the environment from pesticide risks.

Public Engagement/Next Steps

Between 2021-2024 DPR hosted more than 8 public input sessions, partnered with counties on four pilot projects and conducted a beta test to inform development. DPR proposed regulations and is finalizing platform design. SprayDays is anticipated to launch in 2025 following finalization of the regulation.
