Application Method 9

Metam Sodium and Metam Potassium Field Soil Fumigation Recommended Permit Conditions for Sprinkler Applications

Scope

In addition to labeling and regulations, DPR recommends the following permit conditions. These permit conditions were developed to mitigate hazards of offsite movement of methyl isothiocyanate (MITC) following applications of metam sodium, metam potassium, and dazomet. DPR risk assessment and incident reports identified excess risk to field workers and bystanders near applications of these fumigants.

DPR recommends <u>prohibiting</u> metam sodium and metam potassium sprinkler applications with <u>no</u> post-application water treatments (see Appendix I for definition of "Post-Application Water Treatment") made. In contrast, for applications with 1, 2, or 3 post-application water treatments, use the buffer zone tables 1 through 12 within these recommended permit conditions. The buffer zone tables attached to this document have been developed for each product, and are arranged by the percentage of active ingredient.

Additional restrictions may apply for fields located within California's nonattainment areas. To determine if a field is within a nonattainment area, go to www.cdpr.ca.gov and click on "A-Z Index" then "Nonattainment area maps." Additional restrictions for nonattainment areas are listed in the volatile organic compound regulations in Title 3, California Code of Regulations (3 CCR) sections 6450 through 6450.2.

CAC discretion

- 1. Follow the most restrictive requirement, whether it is the label, regulations, or local CAC's adopted permit conditions. DPR may provide specific guidance about exceptions.
- 2. The CACs have the discretion to use mitigating conditions based on the local use conditions that have worked for them in the past.
- 3. These recommended permit conditions are based on the fairly limited data that DPR has available. This data does not cover all environmental conditions, climates, soil types, etc.

Emergency response plan

The county agricultural commissioner must be notified immediately if the emergency response plan is implemented.

Continued

Restrictions near Schools, Day care centers, and Preschools

- 1. All applications are prohibited ½ mile or less from the perimeter of a school property (see Appendix I for definition of "School") unless the school is not scheduled to be in session during both the application and the 36-hour period following the end of the application.
- 2. For applications made greater than ½ mile up to 1 mile from the perimeter of a school property unless the school is not scheduled to be in session during both the application and the 36-hour period following the end of application, several restrictions apply including:
 - A minimum of three post-application water treatments, unless it meets the requirements of CAC discretion detailed under "Post-Application Water Requirements" later in these permit conditions;
 - field monitoring every hour for 12 hours following application; and
 - applications that comply with the "Application Method Requirements" and "Emergency Response Measures: Offsite Movement Suppression Requirements" as described below.

Application method requirements

Two types of sprinkler applications are allowed:

- 1. Daytime applications, and
- 2. 4 a.m. start nighttime applications.

The following requirements apply to <u>all</u> sprinkler applications of metam sodium and metam potassium:

- All application equipment must be inspected immediately prior to use to assure it is in good working condition.
- All irrigation equipment that will be used for post-application water treatments must be inspected and tested prior to beginning the application to assure it is in good working condition.
- The permittee or permittee's authorized representative, who is knowledgeable of the irrigation system, must be present at the treatment site during the application and must be trained as a pesticide handler. Employees must be trained pesticide handlers.

Continued

Application method requirements (continued)

1. Daytime applications

In addition to the requirements for <u>all</u> applications, for daytime applications the application block size cannot exceed 50 acres treated within 24 hours. Use Tables 1 and 2 to determine the maximum block size for daytime applications.

Table 1. Maximum Size of Application Block Treated Within 24 Hours for Daytime Sprinkler Applications Near "Schools"

| Distance to Perimeter of Nearest School* Property | Maximum Application Block Size |
|--|---------------------------------------|
| ½ mile or less and school is scheduled to be in session | Application prohibited |
| Greater than ½ mile and up to 1 mile, and school is scheduled to be in session | 25 acres |
| Greater than 1 mile, or school is not scheduled to be in session during both the application and the 36-hour period following the end of the application | 50 acres |

^{*}See Appendix I for definition of "School"

Table 2. Maximum Size of Application Block Treated Within 24 Hours for Daytime Sprinkler Applications Near "Occupied Structures" or "Bystander Areas"

| Distance to Perimeter of Nearest Occupied Structure or Bystander | Maximum Application Block Size | | | | | | |
|---|--------------------------------|--|--|--|--|--|--|
| Area* | | | | | | | |
| ½ mile or less | 25 acres | | | | | | |
| Greater than ¼ mile | 50 acres | | | | | | |

^{*}See Appendix I for definitions of "Occupied Structure" and "Bystander Areas"

Continued

Application method requirements (continued)

- 2. 4 a.m. start nighttime applications
 In addition to the requirements for <u>all</u> applications, nighttime applications
 must meet the following conditions:
 - Start no earlier than 4 a.m.
 - Application block size cannot exceed 25 acres treated within a 24-hour period.
 - The metam sodium or metam potassium application must be metered evenly over a six-hour application period.
 - A minimum of two post-application water treatments must be applied.

This method is allowed year round. However, in the San Joaquin Valley, Southeast Desert, or Ventura ozone nonattainment areas between May 1 and October 31, 4 a.m. start applications must be made at the reduced rates listed below:

- i. The metam sodium application rate must not exceed 260 pounds active ingredient per acre (lbs ai/A).
- ii. The metam potassium application rate must not exceed 290 lbs ai/A.

Offsite movement suppression requirements: emergency response measures For all sprinkler applications, the certified applicator supervising the application must verify that the operator of the property to be fumigated has the capability to respond to offsite movement of MITC. The specific capability required is shown in Tables 3 and 4. The supervising certified applicator must document that capability in the Emergency Response Plan located in the Fumigation Management Plan.

Table 3. Required Capability to Suppress Offsite Movement Near "Schools"

| Distance to Perimeter of Nearest | Water Treatment Requirements |
|-------------------------------------|--------------------------------|
| School* Property | |
| ½ mile or less and school is | Application prohibited |
| scheduled to be in session | |
| Greater than ½ mile and up to 1 | Irrigation equipment and water |
| mile, and school is scheduled to be | available for 48 hours |
| in session | post-application |

^{*}See Appendix I for definition of "School"

Continued

Offsite movement suppression requirements: emergency response measures (continued) Table 4. Required Capability to Suppress Offsite Movement Near "Occupied Structures" or "Bystander Areas"

| Distance to Perimeter of Nearest Occupied Structure or Bystander Area* | Water Treatment Requirements |
|--|--|
| 1/4 mile or less | Irrigation equipment and water available for 48 hours post-application |
| Greater than ¼ mile up to 1 mile | Irrigation equipment and water available for 24 hours post-application |
| Greater than 1 mile | Exempt (not required) |

^{*}See Appendix I for definitions of "Occupied Structure" and "Bystander Area"

- 1. When planning to use water to suppress offsite movement, the certified applicator supervising the application must select, and document in the Emergency Response Plan located in the Fumigation Management Plan, a combination of water quantity, irrigation rate, and duration that meets all three of the following specifications:
 - total quantity of 0.20–0.40 inches of water over the treatment site,
 - irrigation delivery rate of 0.15–0.25 inches per hour, and
 - irrigation duration of 2–3 hours.

The ranges of 0.20–0.40 inches of water and 0.15–0.25 inches per hour allow the CAC to determine the amount of water required based on local conditions such as soil type and moisture content, and air and soil temperature at the time of application.

- 2. Follow the application site monitoring requirements under "Application Site Monitoring Requirements" detailed later in these permit conditions.
- 3. Whenever offsite movement of MITC is detected, cease the application (if still underway) and initiate the Emergency Response Plan indicated in the Fumigation Management Plan.
- 4. The county agricultural commissioner must be notified immediately if the emergency response plan is implemented.
- 5. Obtain authorization from the CAC prior to restarting any application that has been ceased due to a response.

Continued

Permit application

Permit applications must include a map of all "occupied structures" and "bystander areas" (see Appendix I for definitions of "Occupied Structure" and "Bystander Area") within ½ mile of the fumigation site and all schools within 1 mile of the fumigation site.

Notice of intent

- 1. The Notice of Intent (NOI) is required to be submitted at least 48 hours prior to the start of fumigation.
- 2. In addition to information required in 3 CCR section 6434(b), the following information must be submitted with the NOI:
 - The number of application blocks to be treated and acreage of each application block.
 - The time (within a 12-hour window) that each application is scheduled to commence. If the application fails to commence within the 12-hour window, a new NOI is required, but another 48-hour waiting period would not be needed unless required by the CAC.
 - The method of post-application treatment to be used to suppress offsite movement, including number of post-application water treatments, if applicable.
 - The buffer zone size and buffer zone duration if longer than required by the label.
 - The certified applicator's 24-hour contact telephone number.
 - Written agreement(s) required by labeling to allow the buffer zone to extend onto any areas not under the control of the owner of application block, if applicable. (Attach these agreements to the Fumigation Management Plan.)
 - Proof that sufficient water is available for application, post-application water treatment, and offsite movement suppression requirements.

 (Also attach to Fumigation Management Plan.)
 - Include the map required for the Fumigation Management Plan in the NOI.

Continued

Application timing

- 1. Daytime sprinkler applications of metam sodium and metam potassium must start no earlier than 1 hour after sunrise and must be completed in time to allow post-application water treatments to begin no later than 1 hour before sunset.
- 2. 4 a.m. start nighttime applications of metam sodium and metam potassium must start no earlier than 4 a.m. and must be completed in time to allow post-application water treatments to begin no earlier than 1 hour before sunrise.

Buffer zones

- 1. Label buffer zone credits are not allowed.
- 2. Tables
 - Use buffer zone tables 1 through 12 as appropriate based on the product and the number of post-application water treatments to determine the buffer zone distance. DPR recommends <u>prohibiting</u> metam sodium and metam potassium sprinkler applications with <u>no</u> post-application water treatments made.
 - If the tables do not capture the specific acreage or application rate, round up to the nearest acre or rate.
- 3. Permission for adjoining properties
 - When the buffer zone of an application block extends onto an area not under the control of the owner of the application block, a written agreement must be submitted with the NOI and attached to the Fumigation Management Plan.
 - If a written agreement is not included in the NOI, the buffer zone cannot encroach beyond the property line of such areas (residential areas, occupied structures, publicly owned parks, etc., as described on the product label).

Application site monitoring requirements

- 1. General Requirements
 - Monitoring information must be recorded on the form "Monitoring During Application (Field Fumigation) DPR-ENF-223" or an equivalent form and attached to the Post-Application Summary.

Continued

Application site monitoring requirements (continued)

- If monitoring indicates a change that could result in offsite movement (e.g., increased or greatly decreased wind speed, change in wind direction toward occupied structures) the certified applicator supervising the application must be ready to carry out the requirements described in the Emergency Response Plan located in the Fumigation Management Plan.
- Application site monitoring as described in this permit condition is separate from the "Fumigant Site Monitoring" option of the "Emergency Preparedness and Response Measures" specified on the label, and must be conducted for each application.
- Whenever "Emergency Preparedness and Response Measures" are triggered, and the "Fumigant Site Monitoring" option is selected, the supervising certified applicator must ensure that the monitoring is conducted as follows:
 - o Monitoring must be done at the outer edge of the buffer zone.
 - Monitoring must be done in the direction of bystanders, residences, and businesses, and in the direction that the wind is blowing.
 - o Monitoring must be done in all directions on calm days (see Appendix I for definition of "Calm Day").
 - Person monitoring must have full olfactory capabilities (e.g., not impaired by allergies or colds)

2. Pre-Application

- Monitor and document wind speed and direction, and soil and air temperature at the application site immediately prior to application.
- 3. During Application
 - The following conditions must be monitored every hour until the application is completed, recorded on the form "Monitoring During Application (Field Fumigation) DPR-ENF-223" or an equivalent form during the application, and attached to the Post-Application Summary:
 - o Wind speed and wind direction; and
 - Any unusual conditions observed at or adjacent to the application site (e.g., odor, reported symptoms of exposure, equipment failure, or spill).

Continued

Application site monitoring requirements (continued)

4. Post-application

- On the day of application, the certified applicator supervising the application must ensure that a trained handler is at the site continually from 1 hour before sunset through 1 hour after sunset, in addition to the periods required to conduct post-application monitoring. If the trained handler is an employee, he or she must have the authority to initiate the Emergency Response Plan whenever needed, or must be able to immediately contact the person who has that authority.
- Post-application field monitoring shall be conducted for 12 hours following application and recorded on "Monitoring Post-Application DPR-ENF-224" or an equivalent form and attached to the Post-Application Summary. Specific monitoring requirements are shown in Tables 5 and 6:

Table 5. Frequency of Post-Application Monitoring Required Near "Schools"

| Distance to Perimeter of Nearest School* Property | Monitoring Requirements |
|--|-------------------------|
| ½ mile or less and school is scheduled to be in session | Application prohibited |
| Greater than ½ mile and up to 1 mile, and school is scheduled to be in session | Every hour |

^{*}See Appendix I for definition of "School"

Table 6. Frequency of Post-Application Monitoring Required Near "Occupied Structures" or "Bystander Areas"

| Distance to Perimeter of Nearest Occupied Structure or Bystander Area* | Monitoring Requirements |
|--|-------------------------|
| ¹ / ₄ mile or less | Every hour |
| Greater than ¼ mile | Every 2 hours |

^{*}See Appendix I for definitions of "Occupied Structure" and "Bystander Area"

Continued

Application site monitoring requirements (continued)

- Each time post-application monitoring is conducted, the following conditions must be monitored and recorded:
 - Wind speed and direction at the application site.
 - o Air temperature at the application site.
 - Post-application watering information (see "Post-Application Water Treatments (Field Fumigation) form DPR-ENF-225").
 Record start and stop times for water treatments, as well as total inches applied.
 - o Any unusual conditions observed at the application site (e.g., dry soil conditions, odor, irrigation equipment failure, or spill).
 - o Monitoring must be done in all directions on calm days.

Postapplication water treatments

- 1. Post-application water treatments are required and must be recorded on the "Post-Application Water Treatments (Field Fumigation) DPR-ENF-225" or equivalent form and attached to the Post-Application Summary.
- 2. Water can be applied at any time in response to odor or illness.
- 3. For each post-application water treatment discussed below, the certified applicator supervising the application must ensure a combination of water quantity, irrigation rate, and duration that meets all three of the following specifications:
 - total quantity of 0.20–0.40 inches of water over the treatment site,
 - irrigation delivery rate of 0.15–0.25 inches per hour, and
 - irrigation duration of 2–3 hours.

The 0.20–0.40 inch range allows the CAC to determine the amount of water required, based on local conditions such as soil type and soil moisture content, and air and soil temperature at the time of application.

All 4 a.m. start nighttime applications require a minimum of two post-application water treatments. For daytime applications, minimum requirements are shown in Tables 7 and 8:

Continued

Postapplication water treatments (continued) Table 7. Post-Application Water Treatments Required for Daytime Sprinkler Applications Near "Schools"

| Distance to Perimeter of Nearest | Water Treatment Requirements |
|---------------------------------------|--|
| School* Property | |
| ½ mile or less and school is | Application prohibited |
| scheduled to be in session | |
| Greater than ½ mile and up to 1 | Minimum of <u>3</u> water treatments |
| mile, and school is scheduled to be | (CAC discretion to reduce to $\underline{2}$) |
| in session | |
| Greater than 1 mile, or school is not | Minimum of <u>2</u> water treatments |
| scheduled to be in session during | (CAC discretion to reduce to $\underline{1}$) |
| both the application and the 36-hour | |
| period following the end of | |
| application | |

^{*}See Appendix I for definition of "School"

Table 8. Post-Application Water Treatments Required for Daytime Sprinkler Applications Near "Occupied Structures" or "Bystander Areas"

| Distance to Perimeter of Nearest Occupied Structure or Bystander Area* | Water Treatment Requirements |
|--|--|
| ¹ / ₄ mile or less | Minimum of <u>3</u> water treatments |
| | (CAC discretion to reduce to <u>2</u>) |
| Greater than ¼ mile | Minimum of 2 water treatments |
| | (CAC discretion to reduce to $\underline{1}$) |

^{*}See Appendix I for definitions of "Occupied Structure" and "Bystander Area"

Continued

Postapplication water treatments (continued)

- 4. Use the following timing for whichever post-application water treatments are applied:
 - Post-application water 1 (Day 1)—Apply a minimum of 0.20–0.40 inches of water to the application block, at a rate of 0.15–0.25 inches per hour, starting within 30 minutes of completion of the application.
 - Post-application water 2 (Day 1)—Apply a minimum of 0.20–0.40 inches of water to the application block, at a rate of 0.15–0.25 inches per hour, on the same day of application, beginning no earlier than 1 hour before sunset and completing by midnight.
 - Post-application water 3 (Day 2)—Apply a minimum of 0.20–0.40 inches of water to the application block, at a rate of 0.15–0.25 inches per hour, on the day following the application, beginning no earlier than 1 hour before sunset and completing by midnight.

5. CAC Discretion

- The CAC has the option to eliminate the third post-application water treatment requirement for application blocks ¼ mile or less from an occupied structure or bystander area based on an evaluation of the soil type and moisture content, knowledge of local conditions, and effective offsite-movement control measures previously used, provided that the application block is greater than ½ mile and up to 1 mile from the perimeter of school property (unless the school is not scheduled to be in session during application and the 36-hour period following the end of the application). Use the buffer zones for two post-application water treatments if the third post-application water treatment is eliminated.
- The CAC has the option to eliminate the second post-application water treatment requirement (except for 4 a.m. start applications) for application blocks **greater than** ½ **mile** from an occupied structure, or bystander area based on an evaluation of the soil type and moisture content, knowledge of local conditions, and effective offsite-movement control measures previously used, provided that the application block is **greater than 1** mile from the perimeter of a school property (unless the school is **not** scheduled to be in session during both the application and the 36-hour period following the end of the application). Use buffer zones for one post-application water treatment if the second post-application water treatment is eliminated.

Appendix I: Definitions

Application: Activities required to incorporate metam sodium, metam potassium, or dazomet into the prepared soil. Applying additional water to the treated soil in order to suppress offsite movement of MITC is not part of the application process.

<u>Bystander Area:</u> An area typically used or visited by people, such as parks, playgrounds, lakes, reservoirs, bus stops, and other similar areas, or other areas identified by the CAC.

<u>Calm Day:</u> Day when wind speeds are forecasted to drop below 5 miles per hour and/or when field observation confirms the same.

<u>Drench Application:</u> Application is made to pre-formed beds or to rows, using low-pressure (30–35 pounds per square inch) booms with nozzles <12 inches above the top of the beds.

MITC: Methyl isothiocyanate. A breakdown product of metam sodium, metam potassium, and dazomet.

Offsite Movement Suppression Requirement: Written procedures that will provide an adequate emergency response in the event MITC odors from metam sodium, metam potassium, or dazomet are detected away from the application site, or symptoms are reported. The plan provides instructions on response procedures to cooperators and employees involved in metam sodium, metam potassium, and dazomet applications. This requirement is separate from the post-application water treatment requirements.

Occupied Structure: A structure that is, will be, or may be occupied at any time during the application and/or buffer-zone period. This includes living and working areas that are associated with the structure (e.g., yard, garden). Homes occupied by the property owner or permittee are excluded from this definition.

<u>Ozone Nonattainment Area:</u> An area designated in Title 40, Code of Federal Regulations section 81.305 for the purpose of air quality planning within the chart titled "California – Ozone (1-Hour Standard)."

<u>Post-Application Water Treatment:</u> Required water that is applied following completion of an application of MITC for the purpose of inhibiting offgassing from treated soils. Each post-application water treatment must be applied following the constraints pertaining to post-application timing, quantity, rate, and duration as listed in the post-application requirements section of the Recommended Permit Conditions.

<u>Power Mulcher Application:</u> Metam is sprayed on or injected under the soil surface immediately in front of a power driven mulcher. The treated soil is mulched with untreated soil at a depth set to where pest control is desired and immediately compressed by a soil compacting device.

Rod Bar Application: Backward-facing hollow tube (rod) attached to a metal blade-like horizontal bar. The rod bar is designed to operate under the surface of pre-formed beds, dispersing metam through holes spaced ½–1 inch linearly along the entire length of the bar. The application is immediately followed by a bed shaper or solid press rollers that compact the soil over the treated area. The rod bar application method is a variation of the shank injection method described on metam sodium and metam potassium product labels. As such, follow the product label requirements for shank injection applications when using the rod bar application method.

Rotary Tiller Application: Metam is sprayed on or injected under the soil surface immediately in front of a power driven tiller. The treated soil is tilled with untreated soil at a depth set to where control is desired and immediately compressed by a soil-compaction device.

<u>School:</u> An institution for the instruction of children from kindergarten through high school. Also included are day care centers and preschools, as defined in the California Health and Safety Code section 1596.76. "Day care center" means any child day care facility other than a family day care home, and includes infant centers, preschools, extended day care facilities, and schoolage child care centers. This excludes family home day care. (Users can find day care centers in their area by going to the following website: https://secure.dss.ca.gov/CareFacilitySearch/. Search by ZIP code, city, or county to find the names and addresses of the following child care centers in a specific area.)

Soil Capping Application: Following a metam sodium or metam potassium band treatment, a minimum of 6 inches of untreated soil is placed over the band.

Spray Blade Application: An 8–14 inch horizontal "V"-shaped blade designed to operate under the soil surface with one or two backward-facing spray nozzles placed under the leading edge. The blade is placed 1–4 inches below the soil surface and the resulting subsurface band is further covered with disk-hillers immediately following to form a minimum 6-inch protective cap over the treated band.
